Set{JSON}

No more silos, please.

What is NetJSON?

data interchange format designed for networking software

Dynamic routing protocols

(eg: olsrd, batman-adv)

Network databases (A.K.A. node-db)

Monitoring tools

Firmwares / OS

(eg: OpenWRT, Raspbian)

What kind of networks?

Community networks!

Also...

Municipal wifi

Research (eg: confine)

ISP (innovative ones)

WTF are you talking about?

Show us some examples!

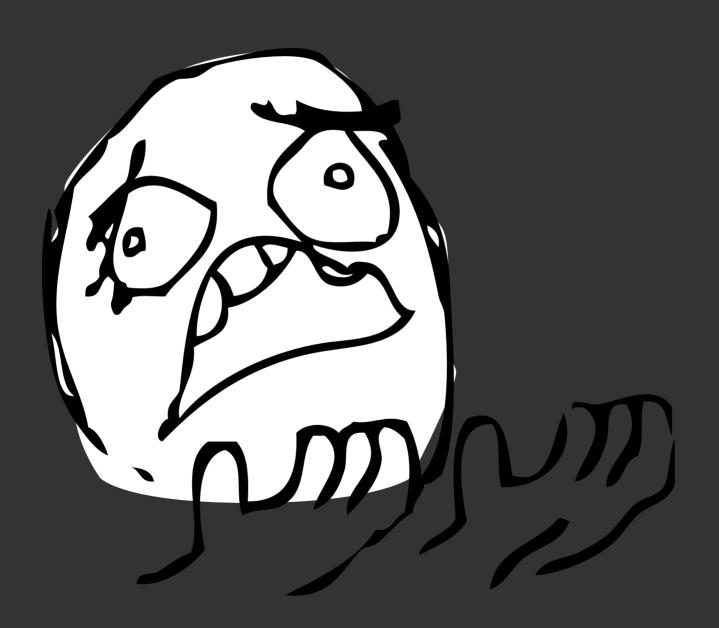

"NetworkGraph"

https://github.com/interop-dev/json-for-networks/blob/master/examples/network-graph.json

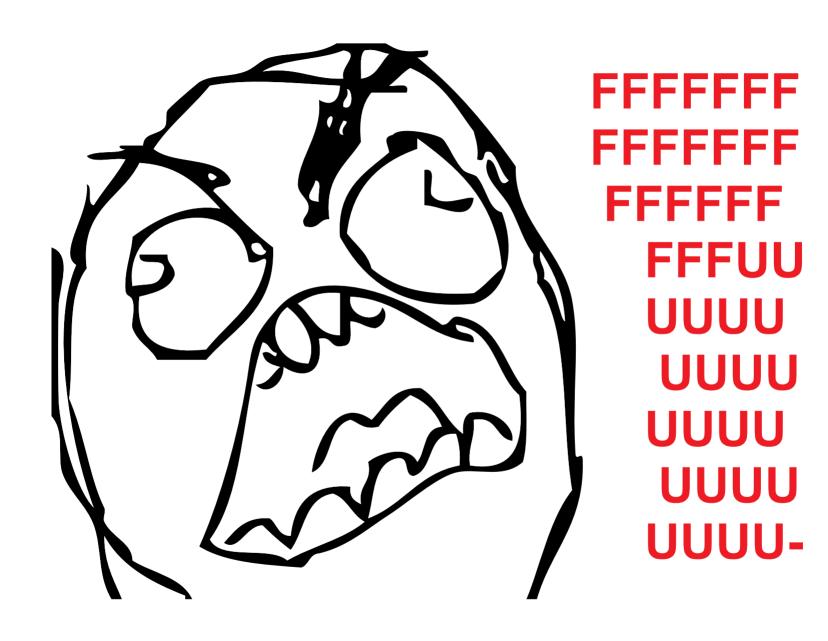

"DeviceConfiguration"

https://github.com/interop-dev/json-for-networks/blob/master/examples/device-configuration.json

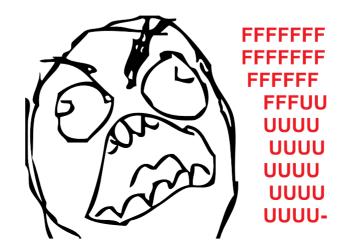

But... why?

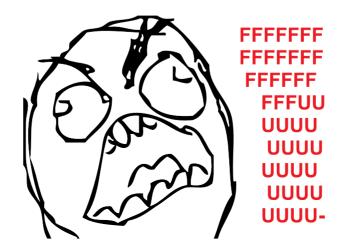

ever tried to develop software for heterogeneous networks?

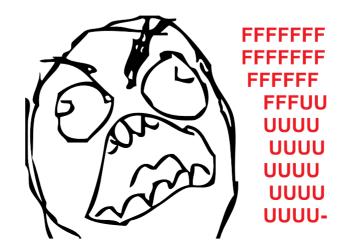

Vendors don't care about interoperability

FOSS projects seem too busy to care either

No standard way to extract and parse data

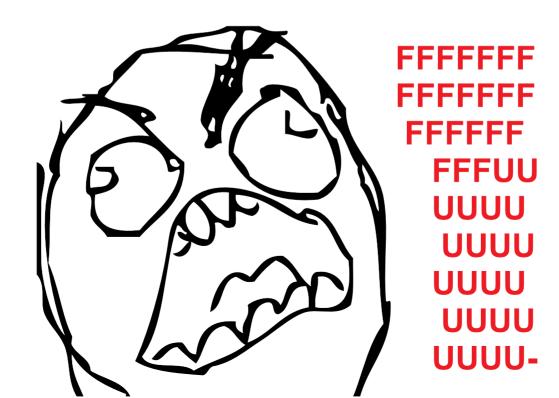

SILOS

4

VENDOR LOCK-IN

VERY SLOW INNOVATION

We can do better than this.

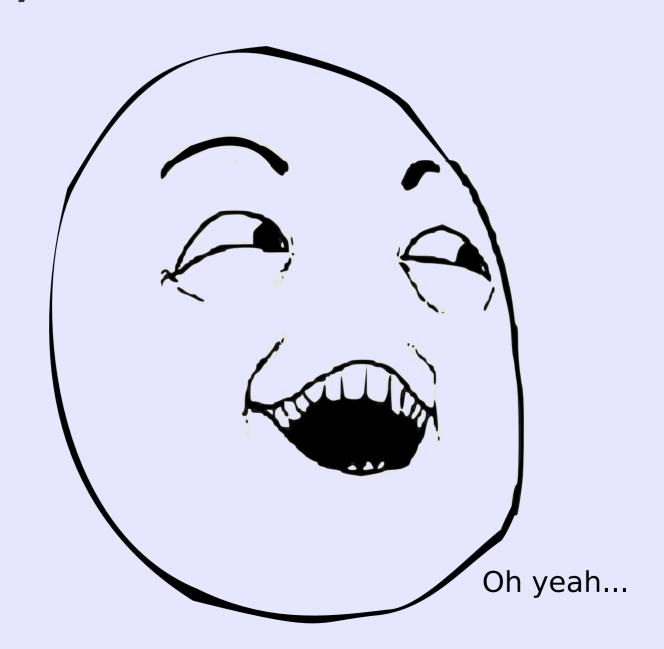

We can achieve interoperability

We can create an ecosystem

We can foster innovation

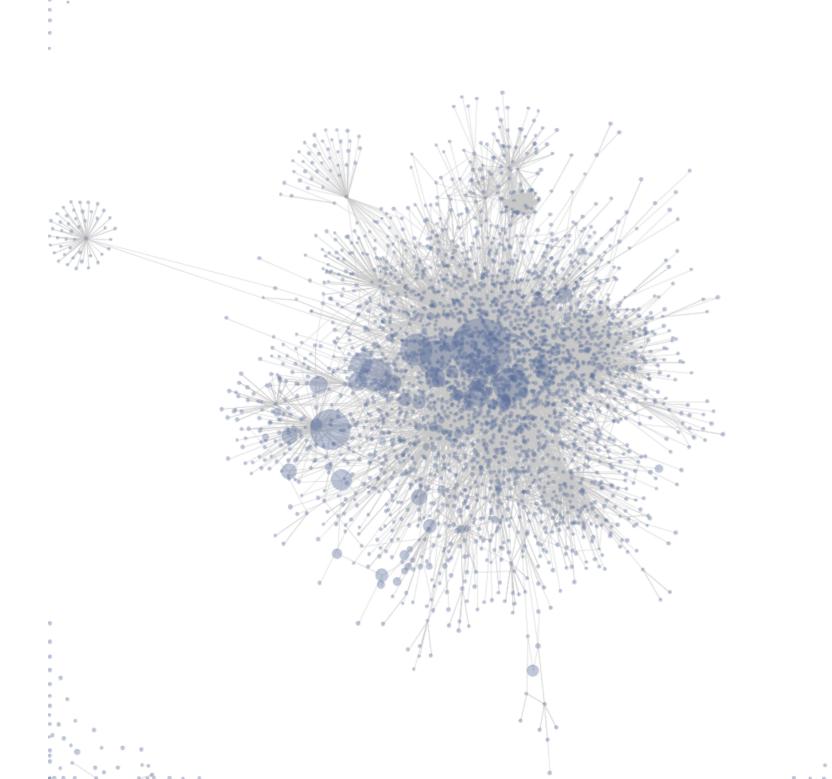

AHAH, innovation ... but how?

Easily import or export device configurations

Understand & visualize network topology

ANY ROUTING PROTOCOL

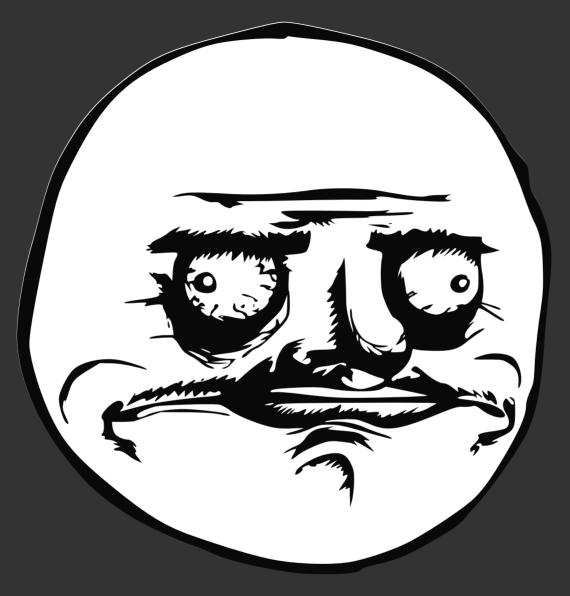

Small libraries developed by different communities

written in different languages

will interoperate

Develop the new cool thing...

And anybody can start using it straightaway!

ME GUSTA

Current implementations?

netdiff

"utilities for parsing network topologies"

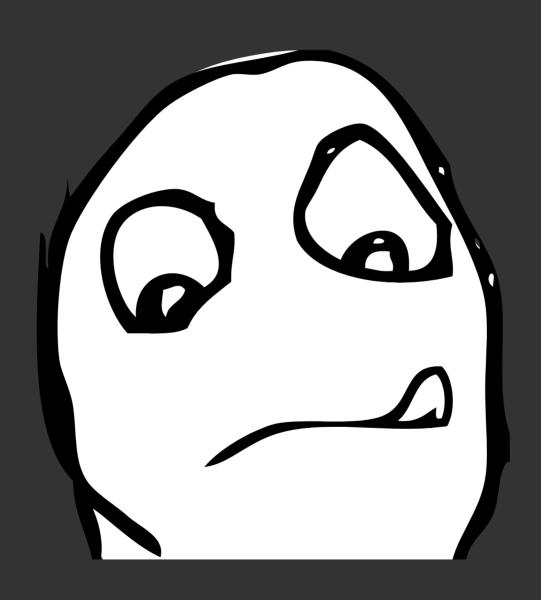

github.com/ninuxorg/netdiff

netengine-utils

"utilities for parsing output of common shell utilities like ifconfig and iwconfig"

github.com/ninuxorg/netengine

We are working on it...

Roadmap

1. Moaar implementations

nodeshot

"crowdmapping for community networks"

github.com/ninuxorg/nodeshot

Javascript d3 library

visualize "NetworkGraph" objects (topology of any routing protocol)

2. Moaar feedback

3. Integrate feedback

4. Freeze specification

5. JSON Schema

6. Validator

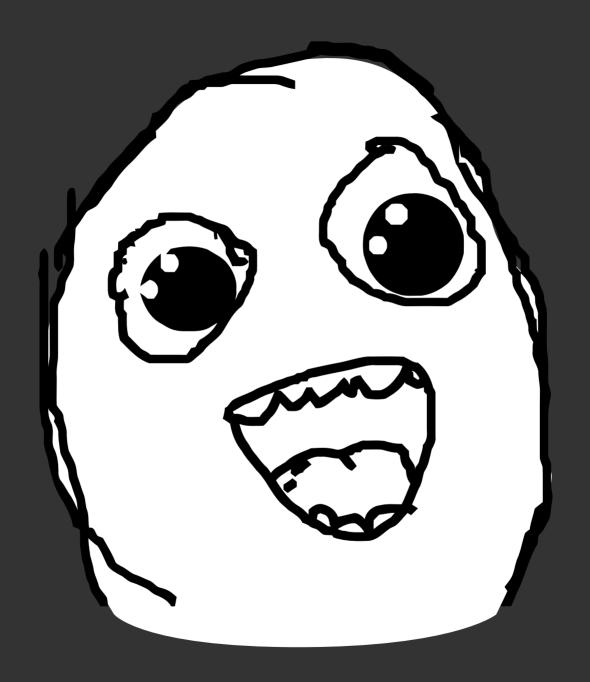

Want to help out?

1. read the spec

(10-15 mins max)

2. try to use netjson

3. send feedback
